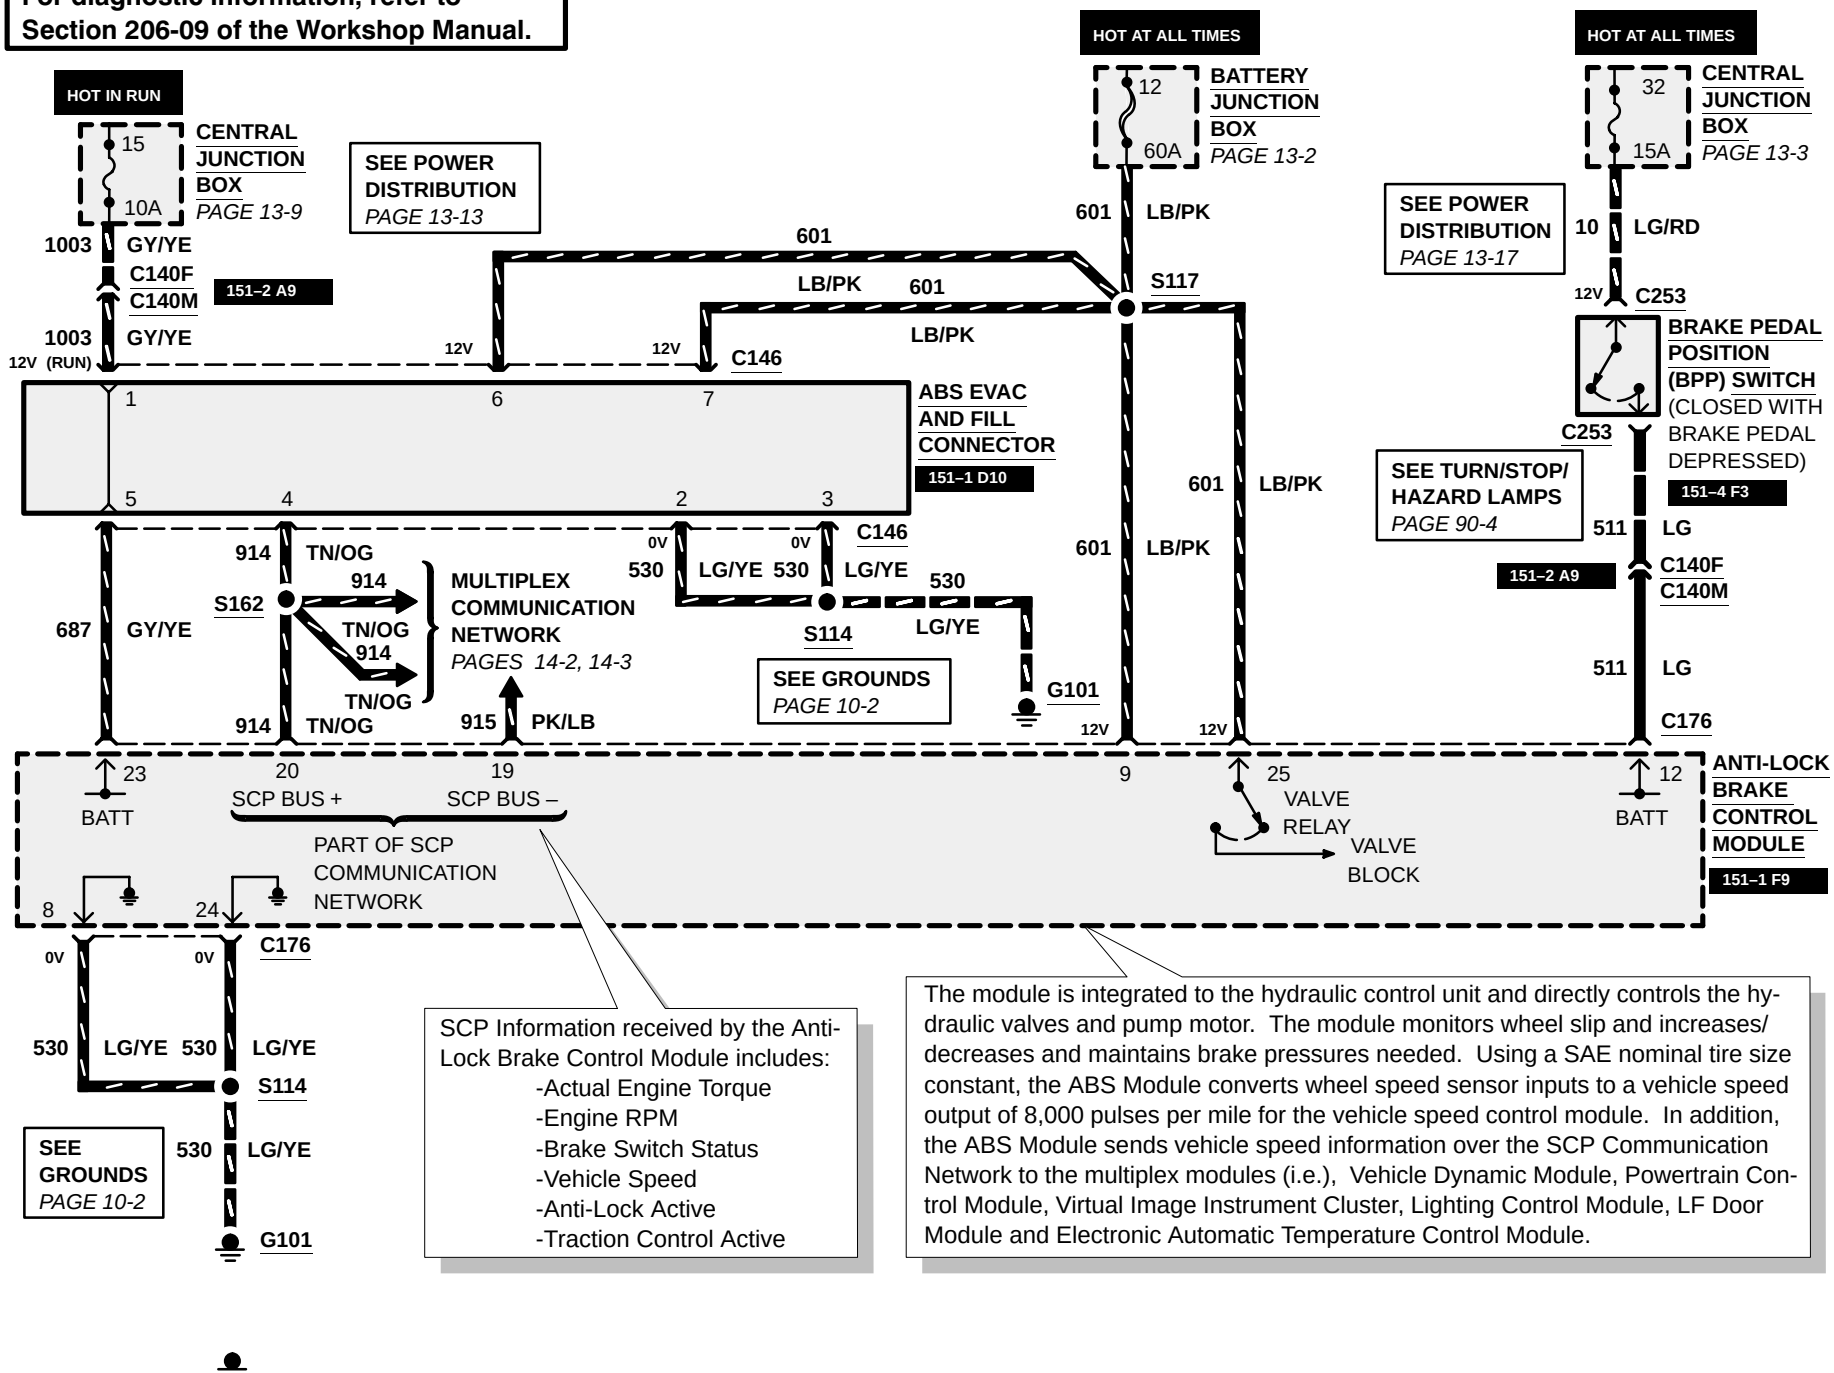
42-1 ANTI-LOCK BRAKES

2001 CONTINENTAL

For diagnostic information, refer to Section 206-09 of the Workshop Manual.



SCP Information received by the Anti-Lock Brake Control Module includes:

- -Actual Engine Torque
- -Engine RPM
- -Brake Switch Status
- -Vehicle Speed
- -Anti-Lock Active
- -Traction Control Active

The module is integrated to the hydraulic control unit and directly controls the hydraulic valves and pump motor. The module monitors wheel slip and increases/decreases and maintains brake pressures needed. Using a SAE nominal tire size constant, the ABS Module converts wheel speed sensor inputs to a vehicle speed output of 8,000 pulses per mile for the vehicle speed control module. In addition, the ABS Module sends vehicle speed information over the SCP Communication Network to the multiplex modules (i.e.), Vehicle Dynamic Module, Powertrain Control Module, Virtual Image Instrument Cluster, Lighting Control Module, LF Door Module and Electronic Automatic Temperature Control Module.
